GeneSafe™ detects de novo mutations in 25 genes causing 44 different genetic disorders. The genetic conditions screened by this innovative test often occur in the absence of a family history of the condition. This is a paradigm shift in prenatal screening. **GeneSafe™** screens for de novo mutations that cannot be detected by standard carrier screening, as these mutations are not present on the parents. The genetic disorders screened by **GeneSafe™** can cause **skeletal dysplasias, cardiac defects,¹⁻²⁻³ multiple congenital anomalies,⁴⁻⁵ autism,⁶ epilepsy⁷ and/or intellectual disability.⁸⁻⁹**
